**Liquid Ice Cosmedicals AG, Swiss**

Dear Gary!

While teaching a master courses on peels and injection in Italy s as well as in my practice in Moscow, the use of the new Ice Mask Clinical formula showed excellent results in different uses.

Ice Mask Clinical Formula use before carrying out Injection techniques in esthetic cosmetology ( Mesotherapy, biorevitalization,bioreinforcing,Injection Plasticity , introduction meso- threads) allows to reduce or eliminate putting topical anesthetics (EMLA,MesoNum) before carrying out procedure.

Applying Ice Mask 10 minutes before the procedure cool evenly and reduces the sensitivity of the receptors for a while sufficient for carrying out the Injection of Mesopreparations, Hyaluronic Acids and Toxins and the introduction of mesothreads. It also reduces the risk of complications such as hypostasis, hemorrhage, bleeding and allergic reactions are decreased substantially.

Sincerely yours,

Alexander Kovalev
